Quick Guide to Ethereum Investment

Investing in an unfamiliar altcoin can be challenging. While similar in many ways to bitcoin, Ethereum presents challenges of which a knowledgeable investor should be aware.

To be a better Ethereum investor, take a look at these common questions about Ethereum investment, along with their answers.

Why Invest in Ethereum?

Ethereum is showing a very strong return-on-investment. With Ethereum showing an 8,861 percent increase in its coin price in a 12-months period, Ethereum presents a potentially viable option for the altcoin investor who may feel that he has been priced out of bitcoin.

Bitcoin's lack of programmability makes it difficult to set up bitcoin-enabled applications, as well. In order to build a bitcoin application, one must be familiar enough with the programming language with which the bitcoin blockchain is established in order to create a transaction verifier while simultaneously being able to create a standalone program that would use this information. This would require creating an infrastructure where the standalone program can be monitored and maintained and where links to the blockchain can be checked regularly. Such an application is neither decentralized nor simple to implement.

With Ethereum, it is easy to set up an application using the blockchain's scripting language that utilizes the altcoin's "smart contract" capabilities. Ethereum-based applications can be run on Ethereum's infrastructure, reducing the expertise and overhead needed to set up a new application. Since Ethereum has more uses available to it than simply being a digital currency, Ethereum may stay relevant longer than bitcoin ultimately.

What is an Ethereum Wallet?

An Ethereum wallet is the ledger – either in digital or physical form – where one's Ether keys are stored. Without these keys, it would be impossible to conduct a transaction with your Ether. Like bitcoin wallets, Ethereum wallets can be publicly or personally stored, can exist on paper or in digital form, and can be stored on a computer or on a personal device.

Ethereum wallets are different from bitcoin wallets in the sense that they have options to manage how much you wish to spend on "gas." "Gas (<https://www.bitcoinmarketjournal.com/altcoin-investment/>)" in an Ethereum transaction is the cost to perform the transaction. Transactions in Ethereum are charged a nominal fee for completion, with this fee going to the miner that discovered the block on which the

transaction will be happening. This rewards those that work to maintain and grow the blockchain while discouraging misuse of the Ethereum

Quick Guide to Ethereum Investment

The Ethereum network is a decentralized platform that runs smart contracts: programs that execute the terms of an agreement. Ethereum is the second-largest cryptocurrency by market capitalization, after Bitcoin.

Ethereum is a blockchain-based platform that allows developers to build decentralized applications (dApps) and smart contracts. It is the second-largest cryptocurrency by market capitalization, after Bitcoin.

Why Invest in Ethereum?

Ethereum is a decentralized platform that runs smart contracts: programs that execute the terms of an agreement. Ethereum is the second-largest cryptocurrency by market capitalization, after Bitcoin.

Ethereum is a blockchain-based platform that allows developers to build decentralized applications (dApps) and smart contracts. It is the second-largest cryptocurrency by market capitalization, after Bitcoin.

Ethereum is a decentralized platform that runs smart contracts: programs that execute the terms of an agreement. Ethereum is the second-largest cryptocurrency by market capitalization, after Bitcoin.

What is an Ethereum Wallet?

An Ethereum wallet is a software application that stores your private keys, which are used to sign transactions and interact with the Ethereum network. There are several types of wallets, including desktop, mobile, and hardware wallets.

Ethereum is a decentralized platform that runs smart contracts: programs that execute the terms of an agreement. Ethereum is the second-largest cryptocurrency by market capitalization, after Bitcoin.

Ethereum is a decentralized platform that runs smart contracts: programs that execute the terms of an agreement. Ethereum is the second-largest cryptocurrency by market capitalization, after Bitcoin.

network.

How Can You Secure Your Ethereum Investment?

Safeguarding your Ethereum investment boils down to two factors: how well you vet your vendors and how seriously you take your own security obligations.

It is important that you take the time to thoroughly research anyone with whom you may be buying, trading, or using Ether. This includes your Ethereum exchange, wallet provider, Ethereum-based ICOs in which you may be investing, and DAPP (decentralized application) providers whose services you may be using. As Ethereum is not regulated as a publicly-traded commodity would be, you must be assured of the risk you are embracing before choosing to partner with an Ethereum vendor.

It is also necessary to take precautions in protecting your wallet. Using two-step verification for passwords and passcodes, not storing wallets on smartphones, keeping backups of your Ethereum keys and passcodes, and advising your loved ones on how to access your wallet in case of death (<https://www.bitcoinmarketjournal.com/bitcoin-estate-planning/>) or incapacitation will all go far to protect your investment. Like bitcoin, should your Ether be lost, there is no known way to recover it.

Can You Invest in Ethereum ETF?

There are fewer options available for those looking for an Ethereum ETF than for a bitcoin ETF. Grayscale Investments has recently announced it will offer shares of its Ethereum Classic Investment Fund for sale on the OTCQX exchange. The trust is a managed portfolio of Ethereum Classic, which is a hard fork of Ethereum that occurred in opposition to the decision to refund the defrauded Ether stolen during the DAO hack.

The SEC is currently considering proposals for Ethereum ETFs. It is thought that, as Ethereum grows in popularity, the pool of Ethereum ETFs will grow as well.

Ethereum is based on radical technology that may one day reshape the entire financial system. Want to know more about investing in radical technologies? Learn how at our Cryptocurrency Millionaire Summit (<https://mediashower.com/ce2/64409/2050/4059>).

Bitcoin ETFs: A Quick Investment Guide

There can be no doubt that bitcoin fever is running high. A meteoric rise in 2017 coupled with some analysts projecting bitcoin prices might hit \$60,000 in the next 12 months, bitcoin remains one of the best-yielding commodities available. It is also one of the most volatile.

For those investors who would rather avoid some of the volatility of the bitcoin market and bypass the difficulty of setting up and maintaining wallets and exchange accounts, monitoring exchange prices, and performing the necessary due diligence needed for an altcoin portfolio, there is another option.

With the New York Stock Exchange filing with the SEC to list bitcoin exchange-traded funds (ETFs) ProShares Bitcoin ETF and ProShares Short Bitcoin ETF, investors can invest in bitcoin in essentially the same way they invest in stocks. Treated similarly to how futures contracts are managed, shares of these funds can be purchased over-the-counter. They also are not necessarily a pool of bitcoin, but rather funds that track bitcoin futures and invest in futures contracts.

These futures contracts, which serve as a hedge to the extreme volatility in the bitcoin market, tend to protect miners, who may lose the incentive to sell new blocks of bitcoin should the coin price drop too much. By separating themselves from the volatility of the market, these funds are safer devices that have more protections than bitcoin itself does.

"By being long Bitcoin Futures Contracts, the Fund seeks to benefit from daily increases in the price of the Bitcoin Futures Contracts," the [ProShares Bitcoin ETF SEC filing \(https://www.cnbc.com/2017/12/20/nyse-files-to-list-bitcoin-etfs-bringing-cryptocurrency-a-step-closer-to-mainstream.html\)](https://www.cnbc.com/2017/12/20/nyse-files-to-list-bitcoin-etfs-bringing-cryptocurrency-a-step-closer-to-mainstream.html) states. "The Fund will not be benchmarked to the current price of bitcoin and will not invest directly in bitcoin. When the price of Bitcoin Futures Contracts held by the Fund declines, the Fund will lose value."

Investing in Bitcoin ETFs

Not all bitcoin funds are futures-based. The [Bitcoin Investment Trust \(https://www.bitcoinmarketjournal.com/what-is-the-bitcoin-investment-trust/\)](https://www.bitcoinmarketjournal.com/what-is-the-bitcoin-investment-trust/), the first publicly-traded over-the-counter bitcoin ETF, is based on shares of a pool of managed bitcoins. In response to the dramatic growth of bitcoin price, price in BIT per share grew 2,027.37 percent over the last 12 months, with the market price per share being \$2,355 as of market close December 26.

ARK Invest includes the Bitcoin Investment Fund in their Innovation EFT products' portfolio. the ARK Web x.o ETF (<https://ark->

[funds.com/arkw](https://ark-funds.com/arkw)), which has seen a 12-months share price increase of 58.57 percent and the ARK Innovation EFT (<https://ark-funds.com/arkk#funddetails>), which has seen one-year price growth of 54.59 percent. Other companies represented in the portfolios include Tesla, Amazon, Twitter, and AthenaHealth.

These funds can be purchased through the NYSE's Arca Exchange, which is where more than 8,000 trade EFTs are listed. The bitcoin-futures EFTs will be tracked either through CBOE or CME. As these instruments will be traded publicly, they will be subject to the same protections any publicly-traded security would be, including the filing of timely due diligence reports by the security's providers, auditing of the managing parties' practices and financial integrity, and the ability to report any wrongdoing to the proper authorities. These are practices that are currently missing for those that invest in bitcoin directly.

Conclusion

While investing directly in bitcoin provides the best profit potential, there are options available for those that wish to invest in bitcoin but not be exposed to all the risk associated with the cryptocurrency. As the bitcoin EFT market grows and expands, the potential of investing in bitcoin as you would a traditional security grows as well, offering both stability and new opportunities in this rapidly-changing financial landscape. For those still afraid of bitcoin, an ETF may be the ideal way to "dip a toe in the pool."

Find out where and when the next profit opportunity will strike [at our Cryptocurrency Millionaire Summit \(https://mediashower.com/ce2/64406/2050/4059\)](https://mediashower.com/ce2/64406/2050/4059).

Three Factors to Consider When Investing in Crypto Mining

If you would like to start making money off cryptocurrencies, you are certainly not alone. Plenty of companies have decided to ride the bitcoin wave.

There is a lot of money to be made here. Goldman Sachs is openly considering this market, and when the gold trader Natural Resource Holdings switched to cryptocurrency, their stock leaped by an astonishing 1,300 percent (<http://www.mining.com/gold-companys-stock-jumps-1300-switching-bitcoin/>). Make no mistake, though, there are very real worries and dangers here as well.

Helping to mine for new crypto tokens (hereinafter “bitcoin” for ease of use) can be both lucrative and an excellent way to contribute to a movement in which you may passionately believe. The benefits are potentially many, but here are a few things to consider carefully before jumping in.

It is still very speculative.

Currently, miners reap 12.5 bitcoins when they successfully unlock a blockchain. At the time of writing, that is worth approximately \$187,000. This is an absolutely enormous reward for winning the cryptocurrency lottery, more than double the average American income, and all for letting someone else use your computer.

Hold your horsepower though, because that value is subject to change by orders of magnitude.

Bitcoin remains an extremely high volatility product whose price is still far more related to market enthusiasm than structural, product-related value. This has created a speculative (<https://www.investopedia.com/terms/s/speculativestock.asp>) market with prices that can rise and fall unpredictably. There is a lot of money to be made here, but do not forget that you can lose it just as quickly and very unpredictably.

It takes an enormous amount of money.

Bitcoin mining is expensive.

This is the corollary to the speculative nature of crypto-mining profits. A lottery ticket is fine when it only costs \$1 to pick up that scratch-and-win, but what about \$5? Or \$10?

What about \$1.6 billion? That is the annual energy cost of global mining for bitcoin alone, a project that uses more electricity per year than

Three Factors to Consider When Investing in Crypto Mining

If you would like to start making more profit from your crypto mining, you are certainly not alone. Many of the companies have decided to take the following steps:

There is a lot of money to be made here. Goldman Sachs is one of the leading companies in the market, and when it's a gold standard, it's a gold standard. Holdings are watched in cryptocurrency, their stock is up by an astonishing 1,000 percent in the last year. <https://www.goldmansachs.com/press-releases/2018/03/goldman-sachs-bitcoin>. Make no mistake, though, there are very real winners and losers here as well.

Bitcoin remains the most popular cryptocurrency, but it's not the only one. There are a lot of other cryptocurrencies out there, and some of them are very promising. The benefits are potentially huge, but there are a few things to consider carefully before investing.

It is still very speculative.

The current market is very speculative. It's a lot of money to be made here, but it's also a lot of money to be lost. The current market is very speculative. It's a lot of money to be made here, but it's also a lot of money to be lost. The current market is very speculative. It's a lot of money to be made here, but it's also a lot of money to be lost.

Hold your breath. The current market is very speculative. It's a lot of money to be made here, but it's also a lot of money to be lost. The current market is very speculative. It's a lot of money to be made here, but it's also a lot of money to be lost.

Bitcoin remains the most popular cryptocurrency, but it's not the only one. There are a lot of other cryptocurrencies out there, and some of them are very promising. The benefits are potentially huge, but there are a few things to consider carefully before investing.

It takes an enormous amount of money.

Bitcoin mining is expensive.

Bitcoin vs. Bitcoin Cash vs. Bitcoin Gold: What Is the Difference?

If you do much reading about the cryptocurrency space, you have likely read about bitcoin, Bitcoin Gold, and Bitcoin Cash. Though at first glance these names may imply similarity, they point to entirely different entities with their own rules and structures.

This guide will look at bitcoin, Bitcoin Gold, and Bitcoin Cash and will explain why there must be so many different flavors of bitcoin. More importantly, it will explain what all of this means for the investor.

Understanding Consensus

Bitcoin Gold and Bitcoin Cash are hard forks of bitcoin. To explain what this means, one must understand how consensus works in altcoins.

Every node in an altcoin network holds a copy of the altcoin's blockchain. When a transaction occurs, it is broadcast across the entire network, so that all copies are updated. Every so often, there may be a disagreement over which of two competing blockchain versions is valid, with the longest blockchain typically winning. This version of the blockchain is the consensus-accepted version, which nodes outside the consensus would be forced to adapt. This prevents both casual mistakes such as a blockchain missing a transaction broadcast and intentional attempts at fraud such as a hacker attempting to manipulate blocks so that coins could be double-mined.

When a group of nodes intentionally decide to defy the will of the consensus by accepting a different iteration of the blockchain than the commonly accepted one, the blockchain bifurcates and is effectively pronged in two different directions. Each prong would then represent a separate altcoin. The prong that preserves the consensus would be recognized as the "original," while the "minority" prong would be regarded as a new altcoin.

Bitcoin Cash and Bitcoin Gold

Bitcoin Cash (<https://www.bitcoincash.org/>) resulted from a disagreement on how to handle bitcoin's scalability problem. As more bitcoin users attempt to process transactions simultaneously, the hard limit on bitcoin's block size will cause a bottleneck that would drive up transaction fees, slow down transaction times, and effectively render bitcoin useless as a real-time currency.

Bitcoin opted to solve this problem with Segregated Witness – a soft fork implemented on August 24, 2017 – which divorces a bitcoin's signature data from its transaction data. With the signature data no longer accessible with the transaction data, bitcoin became less malleable and safer, and with the definition of a block changed from one million bytes to one million units with the signature data strategically compressed, the average block grew from one megabyte to 1.8 megabytes, temporarily solving the scalability issue.

There were those in the bitcoin community, however, that felt that Segregated Witness only kicked the scalability problem further down the

Bitcoin vs. Bitcoin Cash: What is the Difference?

Bitcoin is a digital currency that was created in 2009. It is a decentralized currency, meaning it is not controlled by any central bank or government. Bitcoin is based on a technology called blockchain, which is a distributed ledger that records all transactions made with the currency.

Bitcoin Cash is a fork of Bitcoin, meaning it is a new version of the currency that was created by splitting off from the original Bitcoin network. Bitcoin Cash was created in 2017 and is based on the same blockchain technology as Bitcoin, but it has some key differences.

Transaction Fees

One of the main differences between Bitcoin and Bitcoin Cash is the transaction fee. Bitcoin has a higher transaction fee than Bitcoin Cash, which makes it more expensive to use.

Bitcoin Cash was created to address the issue of high transaction fees. It has a larger block size than Bitcoin, which allows for more transactions to be included in each block. This means that Bitcoin Cash transactions are faster and cheaper than Bitcoin transactions.

Another difference between Bitcoin and Bitcoin Cash is the mining process. Bitcoin uses a process called proof of work, which requires miners to solve complex mathematical problems in order to create new blocks. Bitcoin Cash uses a similar process, but it has a different set of rules for mining.

Bitcoin Cash vs. Bitcoin Gold

Bitcoin Gold is another fork of Bitcoin, created in 2017. It is based on the same blockchain technology as Bitcoin and Bitcoin Cash, but it has some key differences. Bitcoin Gold is designed to be more private than Bitcoin and Bitcoin Cash, and it has a different set of rules for mining.

Bitcoin Gold is a controversial currency, and it has been criticized for being a scam. However, it has a dedicated community of supporters who believe in its potential. Bitcoin Gold is still a relatively new currency, and it is not yet clear what its future will be.

road. To them, it did not constitute a fix, and may even have exaggerated the problem due to a hardened posture by the community to entertain another fork. After Segregated Witness was proposed but before it was implemented, Bitcoin Cash – which increased the block size to eight megabytes – was launched via a rejection of all Bitcoin blocks and transactions to Bitcoin Cash blockchains after 13:20 UTC August 1, 2017.

The birth of [Bitcoin Gold \(https://bitcoingold.org/\)](https://bitcoingold.org/) was somewhat less dramatic. A key component of bitcoin mining is difficulty, or how difficult it is to find a new block's hash that is below the current target. The target is an extremely large number that all Bitcoin clients share which marks the position on the blockchain a new block must be under to be valid. The first miner that comes up with a block header hash that is below the target and below the last-mined block gets to claim the new block, with the network continuously lowering the target after every 2016 blocks.

The problem lies in the fact that the lower the target, the harder it is to come up with a winning hash. It has gotten to the point that bitcoin mining has become prohibitively expensive for the average user, leaving mining in the hand of major mining conglomerates who have access to banks of mining-specific computers called ASICs. This creates a de facto central authority with bitcoin, with these super-miners controlling significant portions of the network's traffic.

Bitcoin Gold, which came online in October 2017, is a way to break free of this. Using the Zcash proof-of-work, Bitcoin Gold is designed to be ASIC-resistant. This means that common users that use their computer's graphics cards to mine have just as much a chance of discovering a Bitcoin Gold block as the super-miners. This restores the democratized, decentralized nature of altcoins to the community, according to Bitcoin Gold users.

What Does All of This Mean?

What all of this mean is that for those that are concerned about bitcoin's future viability, there are options available. While neither Bitcoin Gold nor Bitcoin Cash has the market presence that bitcoin enjoys, time will tell if the changes made to create these new altcoins are proven right or not. For an investor, the ability to directly address the problems of one commodity and transition to another commodity that immediately remedies your concerns makes altcoins unique and more likely to be a continued presence in the financial markets for the conceivable future.

As all three are primarily digital currency altcoins, your choice between the three should be a reflection of your trust in the altcoin and your belief in the potential of the investment.

Quick Guide to Ripple Investment in 2018

Are you considering adding Ripple to your portfolio? The payment remittance and settlement altcoin has been making some noise as of late. It has taken Ethereum's place as the second-largest altcoin by market capitalization, it has concluded a one-year price rally in excess of 45,700 percent, and the list of banks and financial institutes that are looking to work with Ripple is growing. If you were to invest in Ripple, you would be in good company.

This guide is to assist those that are still on the fence about investing in Ripple. Ripple, unlike bitcoin, is not purely a digital currency, and unlike Ethereum, is not a platform for building other blockchain applications. Ripple is a fully-implemented, single-focus solution to a real-world problem. Understanding Ripple can serve as a bridge toward embracing other solution-based blockchain projects.

Why Might Investors Choose to Invest in Ripple in 2018?

Ripple's success is tied directly to the number of businesses that are willing to work with it, either via experimentation or active partnerships. Ripple offers a solution to a major stumbling block in international finance.

As it stands today, for a business or individual to transmit or receive money internationally outside of a banking network, it must negotiate with every financial institution the funds may cross along the way. This can take days. Additionally, every transmitting partner may demand a transaction fee for their services, significantly adding to the final cost of the transmission. Finally, as international payments can become "lost" using this methodology, bankers at the originating bank must either monitor the transaction's path themselves or pay a service to do the monitoring, adding needed labor and even more cost.

While SWIFT, the international banking remission, payment, and settlement (RPS) provider, has introduced a blockchain solution to remedy this, SWIFT is only using blockchain as a supplement to its existing service. Ripple is a fully blockchain-integrated solution. Creating a new transfer protocol, the Interledger Protocol, Ripple enables customers to transfer value-holding XRP as if someone was transferring data over the Internet's HTTP protocol. Using this, what once took days can be transferred in less than five seconds, the same a peer-to-peer transfer would happen.

The financial community is taking sides over whether to pick Ripple or SWIFT, with Ripple gaining ground. While SWIFT is the standard for more than 11,000 banks, Ripple offers a faster, less intrusive service at a cheaper price point. What is stopping Ripple from dominating the RPS market is trust; many banks are just not ready to trust multi-million dollars transmission to new technology. There is also the open question of how regulators will react to a blockchain-RPS solution, although the Federal Reserve has indicated that it is receptive to the idea.

What Are Some Way to Invest in Ripple in 2018?

The easiest way to invest in Ripple is to buy XRP. XRP is an exchange-traded asset, available at altcoin exchanges such as BitStamp, Kraken, GateHub, CoinOne, Bitso, CoinCheck, Korbit, Qryptos, and BitBank. Some exchanges accept fiat currency in exchange for XRPs, while others only accept bitcoin.

Another way is to invest in a market commodity that has XRP in its commodity basket. One such commodity is the Arrington XRP Capital Hedge fund, which is the first hedge fund denominated in an altcoin (<http://fortune.com/2017/11/28/arrington-xrp/>) instead of a fiat currency.

Finally, investing in a Ripple partner bank can be construed an investment in Ripple. While the number of banks that actively are using Ripple

technology for its RPS methodologies is small, it is significant and is thought to be an important boon to the institutions' bottom lines. These banks, due to lowered RPS transaction fees, are more likely to increasingly engage in international transfers and the Forex market, marking them for larger potential profit margins in the future.

What is the Future Valuation of Ripple?

The future valuation of Ripple depends wholly on how Ripple fares in the Ripple/SWIFT Wars. It is important to understand that the estimate for SWIFT is that the system transfers about five trillion USD per day (https://www.fincen.gov/sites/default/files/shared/Appendix_D.pdf). That is slightly more than 1.8 quadrillion USD per year. For comparison, the total of the world's assets and debts combined equals roughly three quadrillion USD, as of 2015.

Should Ripple become the dominate RPS methodology, XRP can see or exceed the \$20 per coin mark. Otherwise, a \$5 or \$10 mark is realistic, considering XRP's current growth, which saw it go from a year-start price of \$0.002 to a current price of over \$3 per coin.

However, concerns over Ripple's concentration of XRP's in the hands of its creators (<https://www.forbes.com/sites/laurashin/2018/01/02/meet-the-crypto-billionaires-getting-rich-from-ripples-xrp/#1b691cf63289>) – Ripple's chairman Chris Larsen is currently worth \$37.3 billion off of XRP's and CEO Brad Garlinghouse is worth a minimum of \$9.5 billion – and the fact that Ripple was made by banking industry insiders for the sake of the industry may spoil the ride in the long run. The possible conflict of interest may contribute to the lack of trust that stands as XRP's biggest hindrance.

Should Ripple succeed, however, it will buoy the entire altcoin market. Acceptance of XRP will convince the major banks to try bitcoin and the other altcoins, lending a significant vote of confidence to the new technology.

Four Reasons to Get Some Ethereum Exposure in Your Portfolio

Warren Buffet once [said](https://www.investopedia.com/ask/answers/031115/what-did-warren-buffett-mean-when-he-said-diversification-protection-against-ignorance-it-makes.asp) (<https://www.investopedia.com/ask/answers/031115/what-did-warren-buffett-mean-when-he-said-diversification-protection-against-ignorance-it-makes.asp>): "Diversification is protection against ignorance. It makes little sense if you know what you are doing." In the world of [cryptocurrencies](https://moneymorning.com/investing/the-pick-and-shovel-play-in-cryptocurrencies/) (<https://moneymorning.com/investing/the-pick-and-shovel-play-in-cryptocurrencies/>), it is impossible to completely know or understand what is happening, especially considering that much of this is new for all involved. In the face of such uncertainty, portfolio diversification is not only wise but necessary to mitigate risk.

A good way to add diversity to your portfolio is to invest in Ether. This article will look at some of the reasons adding Ether may be right for you.

Reason One: It Is More Useful than Bitcoin

Bitcoin is solely a financial coin. It was designed and intended only to convey monetary worth. [Ethereum](https://www.ethereum.org/) (<https://www.ethereum.org/>), however, was designed to be a means to express [smart contracts](https://www.bitcoinmarketjournal.com/smart-contracts/) (<https://www.bitcoinmarketjournal.com/smart-contracts/>), or autonomous bots which automatically complete and report transactions between two parties without the need of a third party. Thus, Ether can be used in distributed ledgers, registries, financial systems, or any data exchange that would benefit from open, peer-to-peer access.

This means that Ether likely will have value and a use long after the coin speculation currently hitting the market dies down.

Reason Two: It Has the Backing of Fortune 500 Companies and the Business Community

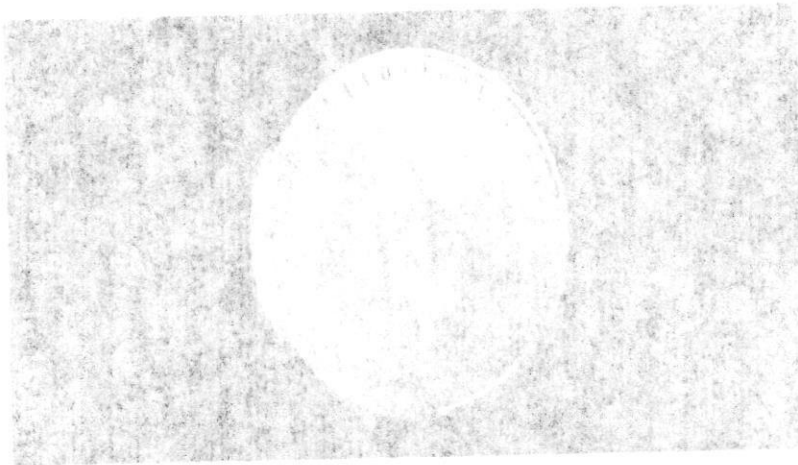

Ether's programmability has made it a darling of the C-suite crowd. In February 2017, a coalition of over 30 major fintech giants – including J.P. Morgan Chase, Microsoft, Intel, Banco Santander, Credit Suisse, and UBS – came together to form the Ethereum Enterprise Alliance. [The group's website](https://entethalliance.org/) (<https://entethalliance.org/>) states: "We will learn from and build upon the only smart contract supporting blockchain currently running in real-world production – Ethereum – to define enterprise-grade software capable of handling the most complex, highly demanding applications at the speed of business."

Many of the members of the Alliance has taken what they have learned and applied it to real-world solutions. J.P. Morgan, for example, has developed [Quorum](https://www.jpmorgan.com/global/Quorum#section_1320553510217) (https://www.jpmorgan.com/global/Quorum#section_1320553510217), which the bank is billing as a blockchain adaptation for use within a financial institution. The Alliance is different from other business blockchain consortiums, such as [R3](https://www.r3.com/about/) (<https://www.r3.com/about/>), which is seeking to solve the business blockchain problem by making a new blockchain named Corda. The Alliance feels that Ethereum's open programming platform makes it optimal for business use without the need to start from scratch.

Reason Three: It Solves the Problems with Bitcoin

Four Reasons to Get Some Ethereum Exposure in Your Portfolio

Ethereum is a decentralized digital currency that can be used to make payments and transfer value. It is the second most popular cryptocurrency after Bitcoin, and its price has risen significantly since its launch in 2015. Ethereum is a platform for building decentralized applications (dApps) and smart contracts, which are self-executing contracts with the terms of the agreement between buyer and seller being directly written into lines of code. This makes it possible to create a wide range of new business models and services that are not possible with traditional centralized systems. Ethereum is also a store of value, and its price has risen significantly since its launch in 2015. This makes it a good investment for those looking to diversify their portfolio. Finally, Ethereum is a platform for building decentralized applications (dApps) and smart contracts, which are self-executing contracts with the terms of the agreement between buyer and seller being directly written into lines of code. This makes it possible to create a wide range of new business models and services that are not possible with traditional centralized systems.

Reason One: It's More Useful than Bitcoin

Bitcoin is the most popular cryptocurrency, but it has some limitations. For example, it is not as easy to use as traditional currencies, and its price is highly volatile. Ethereum, on the other hand, is designed to be a more useful platform for building decentralized applications (dApps) and smart contracts. This makes it a more attractive investment for those looking to diversify their portfolio. Additionally, Ethereum has a larger developer community than Bitcoin, which means there are more dApps and smart contracts being built on the platform. This makes it a more liquid market and a more attractive investment.

Reason Two: It Has the Backing of Fortune 500 Companies and the Business Community

Ethereum has gained significant traction in the business community, with many Fortune 500 companies investing in the platform. This includes companies like JPMorgan Chase, which has invested in Ethereum to develop a digital currency for its clients. Other companies, like Microsoft and IBM, have also invested in Ethereum. This shows that Ethereum is not just a speculative investment, but a platform that is being used by major corporations. This makes it a more attractive investment for those looking to diversify their portfolio.

Ethereum is also a platform for building decentralized applications (dApps) and smart contracts, which are self-executing contracts with the terms of the agreement between buyer and seller being directly written into lines of code. This makes it possible to create a wide range of new business models and services that are not possible with traditional centralized systems. This makes it a more attractive investment for those looking to diversify their portfolio. Finally, Ethereum is a store of value, and its price has risen significantly since its launch in 2015. This makes it a good investment for those looking to diversify their portfolio.

Reason Three: It Solves the Problem with Bitcoin

Reason Three: It Solves the Problems with Bitcoin

Bitcoin was created with an extremely narrow focus, namely, to prove that a digital currency can exist that is both decentralized and devoid of the potential duplication and transaction fraud such currency was subjected to at the time. While bitcoin met its challenge wonderfully, it may not be up to the challenge its presence created – that is, to find a way to use bitcoin's technology in a way that can practically solve the world's data management problems and can solve the problems of bitcoin's latency and limited supply.

Ethereum was made with the benefit of having bitcoin as an inspiration. It was designed to avoid the pitfalls bitcoin is currently enduring, including limited use, a future where bitcoin has become the equivalent of digital gold instead of a currency, and an infrastructure not designed to accommodate large numbers of simultaneous users. This gives Ethereum greater future potential than bitcoin.

Reason Four: It Has Proven to be Exceptionally Profitable

Ethereum started 2017 at \$10 a coin. It ended the year at \$700 (<https://etherbase.org/>). Even though Ripple has surpassed Ethereum in market capitalization, Ethereum remains second only to bitcoin in coin price and market share. In 2018, it is felt that Ethereum will go higher, with most feeling that it is likely to see a \$1,000 coin price by the end of the year and possibly even \$2,000. Furthermore, some feel that Ethereum is on pace to surpass bitcoin in the near future as the dominant altcoin.

For these reasons, it may be wise to consider adding Ethereum to your portfolio. Having [altcoin diversification](https://www.bitcoinmarketjournal.com/bitcoin-investment-portfolio/) (<https://www.bitcoinmarketjournal.com/bitcoin-investment-portfolio/>) will not only reduce your risk, it may allow you to benefit from early positioning, considering the potential for an Ethereum surge.

Bitcoin is in a bubble; here's what to do...

The richest Americans are all talking about the same asset right now – Bitcoin.

Its meteoric rise in 2017 has turned the investing world upside down. But as much as they love to talk about it, the wealthiest Americans aren't jumping like you'd expect them to.

They seem to think that Bitcoin's rise is all but over.

Most of the gains to be had from Bitcoin have already been made. Sitting at a price of over \$7,000 today, ordinary investors are getting a serious case of sticker shock.

Which has presented us with a new up-and-coming digital currency.

Unlike Bitcoin, this currency isn't making front page news left and right. However, those in the know in Silicon Valley insist that it will be essential to the full adoption of digital currency into everyday American life...

This little-known digital currency (<http://cryptocurrencyvirtualportal.com/cc2cwcf.php?iris=800060&src=ob>) has soared in 2017. In fact, the gains investors have seen from this new currency are even BIGGER than what Bitcoin investors are making...

But it's still in its infancy (unlike Bitcoin). Even though many of my fellow Silicon Valley experts are preparing for it to explode, most ordinary investors haven't even heard of it.

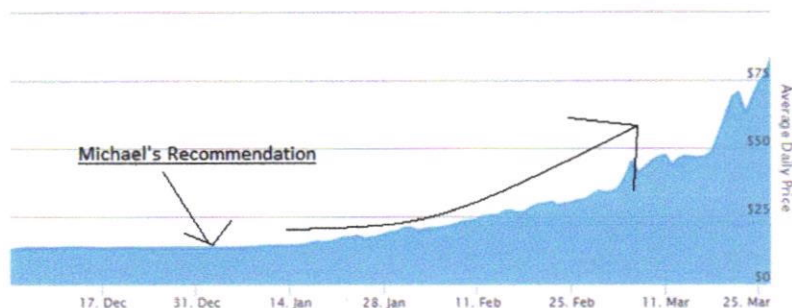

Today, it can be had for much cheaper than the bloated price of Bitcoin. We're urging you to learn more about this once-in-a-lifetime opportunity right now before you hear about it from mainstream news outlets.

Because if history is any indication, once the media starts paying attention, this **new digital currency** (<http://cryptocurrencyvirtualportal.com/cc2cwcf.php?iris=800060&src=ob>) is likely to blow up, and it will already be too late to capture most of the profits.

As any Bitcoin investor will tell you, it often doesn't matter how much you put into this industry-shattering new technology...

What matters the most is that you **"get in"** (<http://cryptocurrencyvirtualportal.com/cc2cwcf.php?iris=800060&src=ob>) early.

That's why Money Morning Venture Capital Strategist, Michael Robinson is sharing **his urgent briefing** (<http://cryptocurrencyvirtualportal.com/cc2cwcf.php?iris=800060&src=ob>) with you today (and revealing exactly what this mysterious new currency is)...

(<http://cryptocurrencyvirtualportal.com/cc2cwcf.php?iris=800060&src=ob>)
